

## CS 325 - Homework 4

1. Which of the following can we infer from the fact that the traveling salesperson problem is NP-complete, if we assume that  $P$  is not equal to  $NP$ ? Explain
  - a. There does not exist an algorithm that solves arbitrary instances of the TSP problem.
  - b. There does not exist an algorithm that solves an arbitrary instance of the TSP problem in polynomial time.
  - c. There exists an algorithm that solves arbitrary instances of the TSP problem in polynomial time, but no one has been able to find it.
  - d. The TSP is not in  $P$ .
  - e. All algorithms that are guaranteed to solve the TSP run in polynomial time for some of the inputs.
  - f. All algorithms that are guaranteed to solve the TSP run in exponential time for all of the inputs.
  
2. Let  $X$  and  $Y$  be two decision problems. Suppose we know that  $X$  reduces to  $Y$ . Which of the following can we infer? Explain
  - a. If  $Y$  is NP-complete then so is  $X$ .
  - b. If  $X$  is NP-complete then so is  $Y$ .
  - c. If  $Y$  is NP-complete and  $X$  is in  $NP$  then  $X$  is NP-complete.
  - d. If  $X$  is NP-complete and  $Y$  is in  $NP$  then  $Y$  is NP-complete.
  - e.  $X$  and  $Y$  can't both be NP-complete.
  - f. If  $X$  is in  $P$ , then  $Y$  is in  $P$ .
  - g. If  $Y$  is in  $P$ , then  $X$  is in  $P$ .
  
3. A Hamiltonian path in a graph is a simple path that visits every vertex exactly once. Show that  $HAM-PATH = \{ (G, u, v) : \text{there is a Hamiltonian path from } u \text{ to } v \text{ in } G \}$  is NP-complete. You may use the fact that  $HAM-CYCLE$  is NP-complete
  
4.  $LONG-PATH$  is the problem of, given  $(G, u, v, k)$  where  $G$  is a graph,  $u$  and  $v$  vertices and  $k$  an integer, determining if there is a simple path in  $G$  from  $u$  to  $v$  of length at least  $k$ . Show that  $LONG-PATH$  is NP-complete.

## CS 325 - Homework 4

5. Graph Coloring. Mapmakers try to use as few colors as possible when coloring countries on a map, as long as no two countries that share a border have the same color. We can model this problem with an undirected graph  $G = (V, E)$  in which each vertex represents a country and vertices whose respective countries share a border are adjacent. The a  $k$ -coloring is a function  $c: V \rightarrow \{1, 2, \dots, k\}$  such that  $c(u) \neq c(v)$  for every edge  $(u, v) \in E$ . In other words the number 1, 2, ...,  $k$  represent the  $k$  colors and adjacent vertices must have different colors. The graph coloring problem is to determine the minimum number of colors needed to color a given graph.

- a. Give an efficient algorithm to determine a 2-coloring of a graph, if one exists.
- b. Cast the graph coloring problem as a decision problem  $K$ -COLOR. Show that your decision problem is solvable in polynomial time if and only if the graph-coloring problem is solvable in polynomial time.
- c. Show that  $K$ -COLOR is in NP. That is if you are given the coloring function  $c$ , you can verify that the graph is  $K$ -colorable.

It has been shown that 3-COLOR is NP-complete by using a reduction from SAT. SAT is NP-complete and there exists a polynomial time algorithm that maps satisfiable formulas to 3-colorable graphs and non-satisfiable formulas to non-3-colorable graphs.

- d. Use the fact that 3-COLOR is NP-complete to show that 4-COLOR is NP-complete.
